

Windows Workstations

Constant, reliable protection

Protection

Our solutions provide protection for your systems and essential data.

Reliability

Our highly qualified and experienced professionals ensure the reliability of our solutions.

Security

Multi-level protection and value-added services – the cornerstones of ultimate security.

Effective protection for your vital data

Today Windows operating systems are the most widely used platforms at work as well as at home. We generally use applications running on these platforms to do most of our daily tasks; moreover, we even run important, critical business applications on Windows networks, workstations and servers. We create, store and transfer more and more vital data on these systems. It threatens us with catastrophic consequences if we are unable to reach these data temporarily or if we lose them. Therefore their protection is an essential task.

Developed for real needs

We created the VirusBuster for Windows product family taking these needs into account in order to protect your data and systems, thereby enabling you to work efficiently. The application has a fully and uniquely modular structure, which makes it widely scalable and flexible to unique environments and needs.

Simple, easy-to-use interface

The simple, component-based user interface and the clear options make it easier to operate your virus protection.

Constant protection

Working in the background, the resident protection provides a constant virus-free environment.

Full support

The well-known VirusBuster quality and reliability is ensured by high-level support and value-added services.

Automatic updates

Your protection can always be up-to-date, thanks to the frequent database and program updates.

Extended file protection

Files can be write, rename and removal protected.

Clear logs

The program components gather information in a central database, so every information can be accessed quickly and easily.

SYSTEM REQUIREMENTS

- Windows 95 / 98 / Me / NT 4.0 WS / 2000 Professional / XP
- Pentium processor or equal
- 32 MB memory (64 MB recommended)
- 10 MB free hard disk space

Built-in multitasking

The application provides you with the capability of creating pre-set jobs that are simultaneously executed and supervised by the built-in multitask-management system. Frequent tasks like program or virus database updates can be scheduled as a job to be performed by the software automatically.

Central alerts

Several events can occur which need immediate interaction, like a detected virus or a successful/unsuccessful update. The program's alert module can forward this information to the desired e-mail address(es) to instantly inform you about anything important.

Intelligent quarantine

Files that cannot be disinfected do not need to be deleted as a final solution. The software is able to store the file safely to rescan and disinfect them after a virus database update. The intelligent quarantine can send files for analysis to VirusBuster's virus laboratory if needed.

High performance scan engine

VirusBuster products are based on the award-winning VirusBuster virus scan engine. The scan engine's high performance and virus recognition ability qualified by independent tests ensure fast and effective virus detection. Manual and scheduled scans are both available in the application. The latter enables you to scan your computer automatically from time to time to make sure it is free from viruses.

Automatic updates

An effective anti-virus software must always be up-to-date, which can be achieved by updating the software itself and the virus database. You can update your software manually at any time or you can set automatic updates. This is needed for your licensed anti-virus software to be able to provide you with the highest level of security. Updates can be performed from either a CD, the Internet or a network path.

Full support

VirusBuster products are backed up by a high quality, full scale technical support. Our value-added services provide you with effective help in creating and maintaining your security system or even in solving critical situations.
